

# Falling and Air Resistance

Bronco skydives and parachutes from a stationary helicopter. Various stages of fall are shown in positions a through f. Using Newton's 2nd law,

$$a = \frac{F_{NET}}{m} = \frac{W - R}{m}$$

find Bronco's acceleration at each position (answer in the blanks to the right). You need to know that Bronco's mass  $m$  is 100 kg so his weight is a constant 1000 N. Air resistance  $R$  varies with speed and cross-sectional area as shown.

Circle the correct answers.

- When Bronco's speed is least, his acceleration is  
(least) (most).
- In which position(s) does Bronco experience a downward acceleration?  
(a) (b) (c) (d) (e) (f)
- In which position(s) does Bronco experience an upward acceleration?  
(a) (b) (c) (d) (e) (f)
- When Bronco experiences an upward acceleration, his velocity is  
(still downward) (upward also).
- In which position(s) is Bronco's velocity constant?  
(a) (b) (c) (d) (e) (f)
- In which position(s) does Bronco experience terminal velocity?  
(a) (b) (c) (d) (e) (f)
- In which position(s) is terminal velocity greatest?  
(a) (b) (c) (d) (e) (f)
- If Bronco were heavier, his terminal velocity would be  
(greater) (less) (the same).

$a = 10 \text{ m/s}^2$

$a = -6 \text{ m/s}^2$

$a = 0 \text{ m/s}^2$

$a = 2 \text{ m/s}^2$

$a = 10 \text{ m/s}^2$

$a = 0 \text{ m/s}^2$

It will  
Be with!
